

Earth Science IV

Name:

Date:

Block:

1. Water Cycle
2. Carbon Cycle

_____ occurs when matter moves from one place to another on Earth. Matter can cycle throughout the Earth both _____ and through _____. In this unit, we will be discussing four major matter cycles: water, carbon, nitrogen, and phosphorus.

Water Cycle

Water is _____ on Earth's _____ in the form of ponds, lakes, rivers, oceans, snow, and ice. It can also be found _____ Earth's _____ in the form of ground water and in the _____ as water vapour.

All water continuously cycles through ecosystems through three main processes:

- _____: Heat from the Sun causes water at Earth's surface to evaporate changing liquid water into water vapour
- _____: As warm air rises, it cools and condenses into water droplets or ice crystals, forming clouds
- _____: Water falls back to Earth's surface when it rains, snows, sleets, or hails

Water is able to travel along Earth's surface as '_____'; it will move downhill back into the ocean due to _____.

Figure 4.16: During the water cycle, water is exchanged among the hydrosphere, atmosphere, and geosphere.

Water can also travel through the _____ by a process called _____. Transpiration occurs when water is _____ by the roots of a _____, carried through it, and eventually it will _____ through small pores in the _____.

Figure 4.17: Studies show that about 10% of water vapour in the atmosphere is released by plants.

How have humans impacted the water cycle?

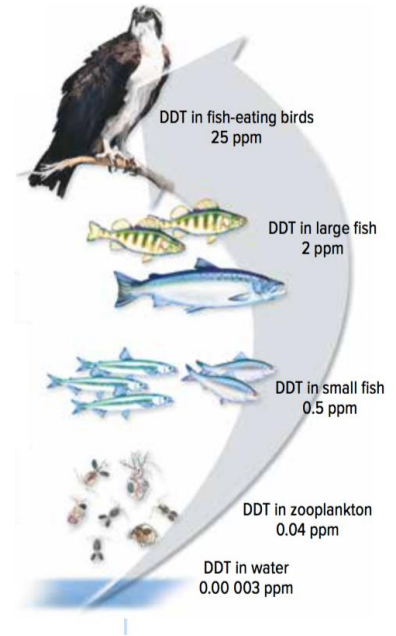

Water can be _____ when the water quality of both fresh and salt water have been _____. This can result in negative effects on organisms and can make water unsuitable for its desired uses.

There are two major types of pollution:

- _____ pollution: a _____ identifiable _____ of pollution that pollutants come from
 - Examples: factories, power plants, sewage treatment plants, oil wells
- _____ pollution: a source of pollution that is difficult to track where it comes from; these pollutants are released in a wide area
 - Examples: run-off from farms, construction sites, parking lots

When pollutants enter into the environment, it is difficult for it to break down. When micro-organisms (phytoplankton, bacteria) eat pollutants in the water (such as pesticides, plastics, etc.), it will _____ in its _____ and body _____. This can lead to bioaccumulation and biomagnification.

- _____: the process where pollutants collect in the cells and tissues of organisms
- _____: the increase in concentration of pollutants in tissues of organisms that are at higher levels in a food chain or food web

Carbon Cycle

Carbon cycles through both abiotic and biotic factors. In the carbon cycle, carbon predominantly exists in the form of _____ gas (_____).

- Carbon dioxide gas moves from the atmosphere into the biosphere through _____ and _____
- Carbon dioxide also moves back to the atmosphere when organisms _____ and _____
- Carbon enters the _____ when the remains of organisms are _____ under _____ layers

Figure 4.20: During the carbon cycle, carbon is exchanged among the biosphere, atmosphere, and geosphere.

Carbon can also be _____ in order to be used for later.

- Some carbon is stored in the woody _____ of living _____
- Some carbon is stored in the _____ remains of _____ buried deep in the ground
 - Over time, this stored carbon transforms into carbon-rich _____
_____ (coal, oil, natural gas)

How have humans impacted the carbon cycle?

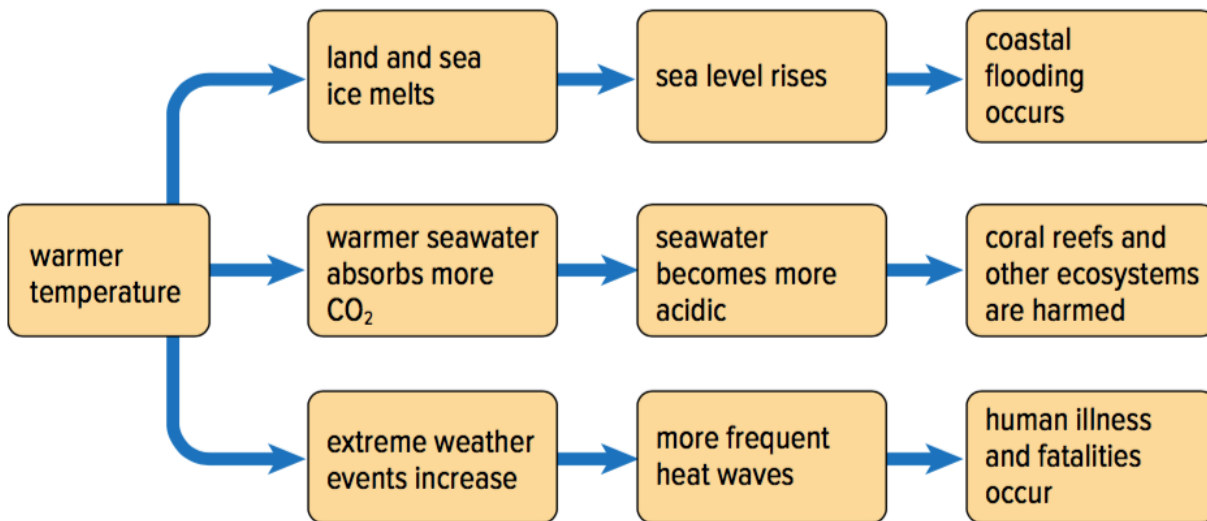

The amount of carbon dioxide used by _____ and given off by _____
_____ is nearly the _____ (carbon dioxide is balanced). Over time, human activities (such as burning fossil fuels, burning trees) have impacted the carbon cycle by releasing excess carbon into the atmosphere. This excess carbon has led to _____ and global _____ as carbon dioxide is a greenhouse gas that traps heat in the atmosphere.

- **Global warming:** An _____ in the average _____ of Earth's surface
- **Global climate change:** A long-term _____ in Earth's _____

The effects of Excess Carbon

Earth's surface temperature: Increased by between _____ and _____ in the past 100 years

- This "small" change can affect conditions in all of Earth's spheres

The effects of a rising sea level:

- Some _____ have gone _____
- Salt water gets into the drinking water supply
- _____ and destruction of wetlands

The effects of the changing ocean chemistry:

- _____ becomes more _____ because it absorbs more carbon dioxide from the air
- An acidic and warming ocean can _____ and _____ themselves (acidity dissolves the organisms' shells)
