Sustainability

What is sustainability?

- Sustainability: the ability to continue to exist indefinitely
- Although organisms in a system may go extinct, as long as there is no severe damage to the system, the ecosystem itself is sustainable
- Ecosystems provide services to all living beings.
- We, and all other living things, depend on ecosystem services

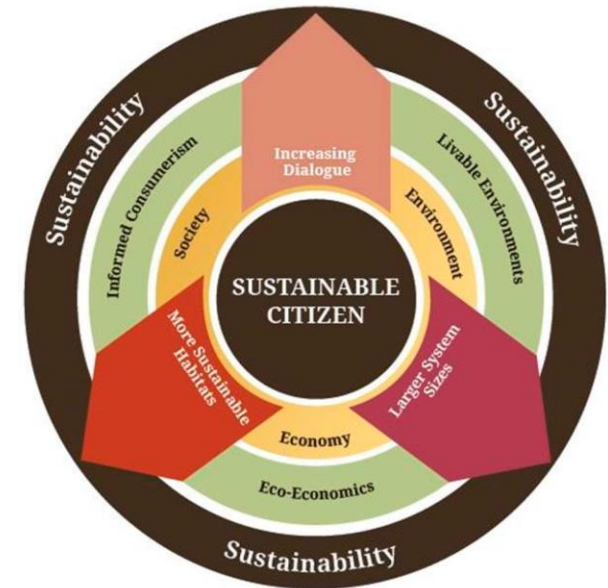

- The idea of sustainability is not a new idea
- Indigenous peoples have been practicing this for centuries, long before Europeans understood this concept
- Indigenous connections to the land and its inhabitants has long been rooted in sustainable ideas of continuation, protection, and respect
- The land is for everyone and all living things should be respected
